## Background

- The postpartum period is a crucial time to initiate family planning (FP) and reduce unmet need for FP among women of reproductive age.
- Currently, the unmet need for FP in Rwanda is 19% (DHS 2015).
- The government of Rwanda, in collaboration with the U.S. Agency for International Development's Maternal and Child Survival Program (MCSP) and other partners, committed to scaling up voluntary

- partners to scale up PPFP in 6 remaining MCSP-supported districts in the country.
- Figure I shows the percent of women delivering in facilities who received PPFP counselling, planned to start a method, were discharged with a method, or declined PPFP.
- As seen in Figure 2, among those women who accepted a method before discharge, a rising proportion were accepting long-acting reversible contraceptives (LARCs), as shown in the graph below

Figure I: PPFP counseling and outcomes among women prior to discharge, 10 MCSP districts

postpartum family planning (PPFP) to help address these issues.

## Intervention

- MCSP supported the Ministry of Health (MOH) to systematically plan, execute, track, and adaptively manage the scale up of voluntary PPFP.
- PPFP scale-up involved:
  - Building the capacity of health care providers
  - Advocating for inclusion of PPFP indicators in the national health management information system (HMIS), including voluntary PPFP uptake before discharge, voluntary PPFP uptake within 6 weeks of delivery, and pregnant who were women counseled and selected a PPFP method during antenatal care
  - Identifying, engaging, and sharing results with key stakeholders

### **Methods**

- In phases I (4 districts) and II (6 districts), MCSP supported the MOH to implement and scale-up PPFP in 10 districts using a modified World Health Organization ExpandNet scale-up approach, including:

-Discharged with a method -Planned -Declined / Refused -Counseling

#### Figure 2:Voluntary postpartum uptake of short-term methods and LARCs

#### Advocacy results

- The Rwandan MOH added PPFP indicators to the revised national HMIS in 2017.
- PPFP is now included as a central part of the latest Health Sector Strategic Plan 2018-2024 and built into the new national FP/Adolescent Sexual and Reproductive Health strategy.
- Training of providers on PPFP counseling and clinical skills
- Provision of supplies and equipment to facilities
- Whole-site orientations, mentorship, supportive supervision visits
- Review of performance data to support high-quality service delivery.
- With the MOH's permission to collect supplemental data on PPFP, a set of indicators around percent of women counseled and outcome of counseling were introduced to measure voluntary uptake of PPFP.
- In July 2017, the government of Rwanda committed to scaling up PPFP in all public health facilities as part of its FP2020 renewal.
- So far, more than 20 (out of 30) districts are currently providing a full package of PPFP methods with support provided in various districts from the MOH, MCSP, and other partners.
